
Eagle all black component

What layers does Eagle use?

Rather, EAGLE will use Layer 1 (top), 2, 15, and 16 (bottom) to bring it all together. Just like Layer 1, this layer contains the copper on the bottom of your board, whether that's from copper pours or individual copper traces. Components placed on the bottom of your board will also have their pads placed here.

What is EAGLE PCB design software?

This exercise covers the use of Eagle (Easily Applicable Graphical Layout Editor) PCB design software to design an electronic schematic and lay out a printed circuit board (PCB). Eagle is a PCB design software package consisting of a schematics editor, a PCB editor and an autorouter module.

What is Eagle used for?

EAGLE can also be used to design multi-layer and single-sided PCBs, non-PTH PCBs, etc. It can also be easily adapted to produce boards with coarser features, suitable for low quality optical processes and manual manufacture. See the EAGLE Configuration Guide for more details of use with different technologies after you have followed this guide.

How do I change a component's value in Eagle?

Use the value command to change a component's value. Do this for capacitors C1 and C2. The smash command can be used to detach the name and value texts from the component, and allow them to be positioned with the move command. All commands in Eagle can be executed from the command line interface.
