What does U_{DC} mean on a DC inverter?

When the DC link voltage of the inverter is u_{dc} , the modulation waves u_{s1} and u_{s2} can be taken as (1), (2)
(1) $u_{s1} = \frac{1}{2} U_{dc} M \cos(\omega t)$ (2) $u_{s2} = \frac{1}{2} U_{dc} M \cos(\omega t + \pi)$ where M is the modulation index ($0 < M < 1$); ω is the angular frequency of AC side output voltage. u_{dc} is the DC link voltage. Fig. 1.

What is the output voltage of a single-phase inverter?

The output voltage of the single-phase inverter is (8) $u_{ab} = u_{dc} M \cos(\omega t) = U_{dc} + u_{pp} \sin(2\omega t) M \cos(\omega t) = U_{dc} M \cos(\omega t) + \frac{1}{2} u_{pp} M \sin(\omega t) + \sin(3\omega t)$ Expression (8) shows that the second ripple voltage of DC link will make the AC output voltage contain abundant third harmonic voltage. 3.

Why does a two-stage single-phase inverter have a second harmonic current?

1. Introduction In the two-stage single-phase inverter, the second harmonic current with twice output voltage frequency exists in the former DC converter because the instantaneous output power of the latter inverter contains the pulsating power of twice the output voltage frequency.

How do you calculate the ripple voltage of a DC chain?

Formula (6) shows that the ripple voltage of DC chain is a ripple voltage twice the frequency of AC voltage. The DC link pulse voltage can be expressed as (7) $u_{dc} = U_{dc} + u_{pp} \sin(2\omega t)$
